

Nymi Enterprise Edition

Always On Authentication

The Authentication Problem

As electronic records become more common in pharmaceutical manufacturing, gaps in data integrity are surfacing - and regulators are watching. As a result, employees waste a lot of time on processes that attempt to guarantee the authenticity of electronic records. However, today's authentication methods have several weaknesses:

- ⊗ **Username and passwords, smart cards, and PINs are easily lost, shared, or stolen**
- ⊗ **Time wasted typing and re-typing passwords**
- ⊗ **Complicated multi-step authentication is increasing friction and slowing down production**

Compliance vs Productivity

Weak authentication is a compliance risk for **regulatory requirements**, such as the FDA's 21 CFR Part 11 and ALCOA+ principles. Strengthening authentication can force companies to put complex procedures in place that are **inefficient** and **cumbersome** for operators to follow.

These requirements compete with the desire to maximize **productivity**.

What if they didn't have to choose?

Case Study: Typing Login Credentials

At a typical pharmaceutical company, shop floor operators can spend on average, **30s** typing their username and password, not to mention second attempts. Common issues include:

- ⊗ **Mistyping and repeated guessing of forgotten passwords**
- ⊗ **Forced lockouts after too many login attempts**
- ⊗ **Typing on touch screens while wearing gloves**

Operators performing e-signatures can type their login credentials into the Manufacturing Execution System (MES) over **200 times** in a single shift.

30s x 200 logins per employee per day = 100 minutes

On top of that, 30% of logins could require a second attempt.

30% second attempts = a total of 130 minutes

How Do You Compare?

An employee could spend
> 2 hours
per shift just typing their
username and password!

Check your company's MES or HMI for a log report of the amount of time spent for logins and second attempts.

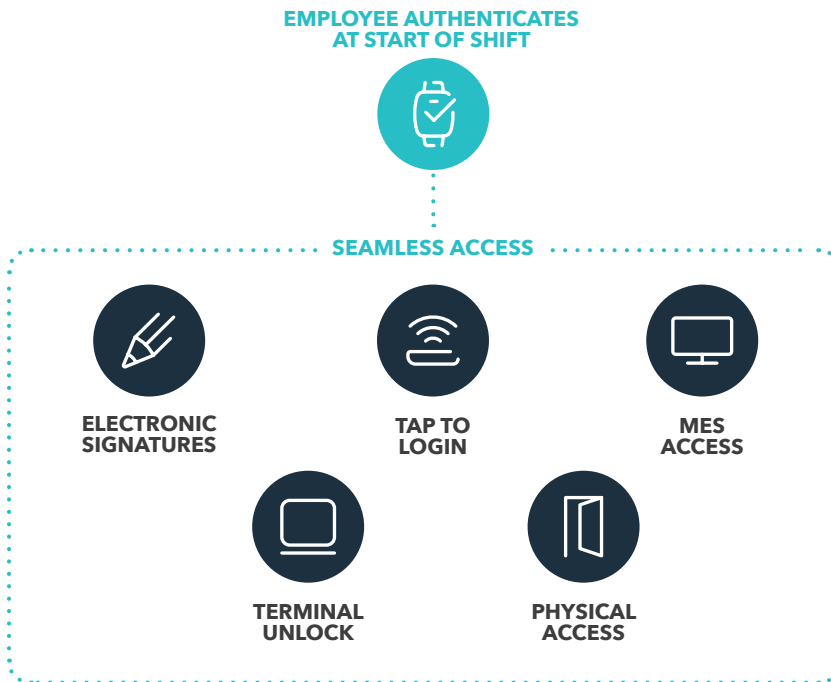

Consider the **productivity** that your operators could achieve if login times were cut in half, **or more!**

Authentication Solved

By making multi-factor biometric authentication as simple as the click of a button or the tap of a reader, today's authentication challenges of friction and security are solved. At the beginning of their shift, operators authenticate to a Nymi Band worn on their wrist. This initiates a long-lasting authenticated state that persists until the device detects that it has come off the wrist.

Nymi Enterprise Edition handles the connection between Nymi Bands, employees, and common shop floor enterprise applications, such as:

- Manufacturing Execution System (MES)
- Human Machine Interface (HMI)
- Enterprise Resource Planning (ERP)

Nymi Enterprise Edition

-  Increased Productivity
-  Data Integrity and Compliance
-  Tighter Security

Ready to Learn More?

Nymi provides on-site workshops and demos to prospective customers. To get in touch with a Nymi Sales Rep, email info@nymi.com.

More information about Nymi Enterprise Edition and its use cases can be found at nymi.com.

Tools to Success

Our Team

Is made up of industry professionals that understand how to go to market and keep your operation running smoothly.

Our Customers

We have experience working with Pharmaceutical Companies, biotech firms, medical device companies

Interested?

Contact us at info@nymi.com to discuss a pilot or a Nymi integration with your product.
